The syringe driver is a simple and cost-effective method of delivering a continuous subcutaneous infusion (CSCI). A CSCI provides a safe and effective way of drug administration and can be used to maintain symptom control in patients who are no longer able to take oral medication. There have been several developments in this field since the third edition of this highly successful book. The text in this edition has been completely revised, incorporating new treatment options and an extensive list of new compatibility data. This book serves as a valuable reference source, providing comprehensive review of syringe driver use and administration of drugs by CSCI. The first chapter provides an overview of syringe drivers and CSCIs, including a useful array of frequently asked questions. The second chapter provides information about the chemistry of drug incompatibility and degradation. The third chapter comprises revised and referenced information relating to most drugs likely to be administered by CSCI using a syringe driver. The fourth chapter discusses the control of specific symptoms that are often encountered when CSCIs are required. The fifth and final chapter contains an extensive, referenced list of compatibility and stability data relating to drug combinations administered by CSCI.

identification of drug combinations administered by

May 29th, 2020 - a continuous subcutaneous infusion csci delivered via syringe pump is a method of drug administration used to maintain symptom control when a patient is no longer able to tolerate oral medication several classes of drugs such as opioids antiemetics anticholinergics antipsychotics and benzodiazepines are routinely administered by csci alone or in combinations

bpj 48 when and how to use a syringe driver in palliative

May 30th, 2020 - infusions for administration via continuous subcutaneous infusion using a syringe driver should be prescribed to run over 24 hours although medicines mixed together may be pharmaceutically patible and stable for longer than this

the syringe driver continuous subcutaneous infusions in

April 26th, 2020 - a continuous subcutaneous infusion is an effective method of drug administration that is particularly suited to palliative care where other routes are inappropriate palliative care patients frequently have multiple symptoms that require the use of numerous drugs the delivery of two three four or even five drugs in the same syringe is now considered routine practice

guidelines for syringe driver management in palliative care

May 31st, 2020 - 2 3 drugs may be mixed in a syringe for a subcutaneous infusion occasionally up to 4 drugs^{6 10} if patibility is an issue the use of two syringe driver devices³ or regular or prn subcutaneous injection should be considered before mixing any drugs together in a subcutaneous infusion check

mixing drugs in the syringe driver pump wm cares

May 31st, 2020 - do not leave drugs in a syringe driver pump for more than 24 hours seek advice from the specialist palliative care team if necessary the book called the syringe driver continuous subcutaneous infusions in palliative care by andrew dickman and jennifer schneider serves as a valuable reference source providing prehensive review of syringe driver use and administration of drugs by csci
